### Choroidal Macrovessel

A choroidal macrovessel appears on fundus photography (Canon CR-2) as an abnormally dilated, tortuous vessel (Fig 1A) that can be misdiagnosed as a parasitic track-like lesion. Evaluation using enhanced depth imaging-optical coherence tomography (OCT) (Spectralis OCT; Heidelberg Engineering, Heidelberg, Germany) reveals prominent hyporeflective vasculature occupying the entire thickness of the choroid (Fig 1B, asterisk), with tent-like elevations of the retinal pigment epithelium and indentation of the photoreceptors (Fig 1B, arrowhead). The course and depth of the macrovessel are highlighted with “en face” OCT, at the level of the choriocapillaris (Fig 1C, arrowhead) and of the choroid, where it demonstrates a reflectivity similar to physiological choroidal vessels (Fig 1D, asterisk).
